

Low Impact Development Stormwater Features in the Right-of-Way

Low Impact Development (LID) stormwater management features have been installed within the right-of-way (ROW) throughout the City of London. The Ministry of Environment and Climate Change's pending requirements for on-site stormwater control will result in many more LID systems being constructed within the City ROW, as part of City led projects.

Utilities and others who work in the City ROW, need to be aware of LID locations to avoid significant costs to recover repairs of LID features. Disturbance of an LID feature may require reconstruction of the entire unique cell to be completed by a qualified contractor.

The table below highlights the locations of LID features constructed or planned to be constructed, to date. For further information please contact the Stormwater Engineering Division.

What Is Low Impact Development?

Stormwater management LID systems are designed to increase infiltration and improve water quality of rainwater runoff. LIDs are designed to address specific site conditions with unique design features. LID practices incorporate "green infrastructure" to support the functions of traditional stormwater infrastructure such as catch basins, storm sewers and outfalls.

Rain gardens located along Commissioner's Road

Rain gardens located along Waterloo Street
